

Interference from BPL has me worried because I operate my Amateur Radio station most of the time at very low power (so called "QRP"). I have to listen for very weak signals (other QRP stations) which could very well be masked by BPL interference.

Since it has been demonstrated that BPL causes interference to other services, I don't understand why the FCC is pushing it. Also, when BPL causes interference to an existing service, BPL should be the one to solve the problem, NOT the original service, as has been proposed.
